

# The measurement layer for the *physical world*.

Hardware-verified environmental data infrastructure. Sensor nodes sign every reading in silicon and anchor it on-chain. **Carbon proved the pipeline; nine verticals scale it.** Operator economics run on USDC validator fees from commercial buyers.

|                                                                |                                                      |                                                     |
|----------------------------------------------------------------|------------------------------------------------------|-----------------------------------------------------|

Built from published V1 unit economics at [launch.malamalabs.com/docs](https://launch.malamalabs.com/docs). Figures are scenario estimates, not commitments.

# Revenue follows *nodes and adoption*.

Three revenue lines, all tied to published unit economics. Each node carries a one-time \$2,000 entry (\$380 hardware, \$1,620 hex license). Ongoing revenue is Mālama's protocol take of USDC validator fees, the commercial revenue operators earn from buyers of hardware-signed data.

NODE DEPLOYMENT — CUMULATIVE (BASE)

MĀLAMA REVENUE BUILD (\$M, BASE)

Source: Pro Forma v2.0, aligned to Validator Fees v0.1 (DOCS-07) and Genesis Pricing v1.0 (DOCS-06).

# Protocol take, license, *hardware margin.*

| REVENUE LINE — BASE (\$)       | 2026 | 2027 | 2028 | 2029  | 2030  |
|--------------------------------|------|------|------|-------|-------|
| Protocol take (validator fees) | 27K  | 524K | 2.6M | 9.4M  | 25.4M |
| Hex license (new nodes)        | 316K | 1.6M | 3.7M | 7.3M  | 13.0M |
| Hardware margin (new nodes)    | 19K  | 95K  | 219K | 428K  | 760K  |
| Total Mālama revenue           | 361K | 2.2M | 6.6M | 17.1M | 39.1M |

The protocol take grows from a rounding error to the dominant line as commercial demand matures. This is the structural thesis: license and hardware revenue bootstrap the network; validator fees compound as the data finds buyers.

# EBITDA positive in *Year 3*.

| P&L – BASE (\$)  | 2026   | 2027   | 2028   | 2029   | 2030    |
|------------------|--------|--------|--------|--------|---------|
| Revenue          | 361K   | 2.2M   | 6.6M   | 17.1M  | 39.1M   |
| Payroll          | (1.4M) | (2.8M) | (4.2M) | (5.6M) | (7.0M)  |
| Non-payroll opex | (108K) | (674K) | (2.0M) | (5.1M) | (11.7M) |
| EBITDA           | (1.1M) | (1.2M) | 413K   | 6.4M   | 20.4M   |
| EBITDA margin    | —      | —      | 6%     | 37%    | 52%     |

# Bear, base, *bull*.

The model's sensitivity runs on two drivers: node count and USDC revenue per node. All three scenarios share the same published unit economics; they differ on adoption pace.

| YEAR 5 METRIC        | BEAR  | BASE   | BULL   |
|----------------------|-------|--------|--------|
| Cumulative nodes     | 7,000 | 16,000 | 28,000 |
| USDC / node / month  | \$260 | \$420  | \$650  |
| Total Mālama revenue | 11.8M | 39.1M  | 102.8M |
| Exit multiple        | 10.0x | 12.0x  | 15.0x  |

# Nine verticals, *independent demand*.

Validator-fee revenue comes from commercial buyers across nine verticals, each with its own regulatory or market driver. No single market carries the model.

## ▲ STAGE-HONESTY

Validator-fee revenue is nascent during the Genesis 200 launch period. The figures here are scenario estimates built on published unit economics, not bookings and not distribution guidance. Pipeline is modeled as pipeline.

# Truth is infrastructure. *Measured, not estimated.*

Mālama builds the hardware-signed measurement layer that physical-world markets need. Carbon proved it. Nine verticals scale it. The model crosses into profitability in Year 3 on conservative adoption, and every figure ties to economics published openly at [launch.malamalabs.com](https://launch.malamalabs.com).
